AB A competitive exclusion (CE) culture of chicken cecal anaerobes has been developed and used in this laboratory for control of Salmonella typhimurium in chickens. The CE culture consists of 29 different species of microorganisms, and is known as CF3. Detection of one of the CF3 bacteria, Eubacteria, and S. typhimurium were demonstrated using a commercial immunomagnetic (IM) electrochemiluminescence (ECL) sensor, the ORIGIN.sup.® Analyzer. Analysis was achieved using a sandwich immunoassay. Bacteria were captured on antibody-conjugated 280 micron sized magnetic beads followed by binding of reporter antibodies labeled with ruthenium (II) tris(dipyridyl) chelate (Ru(bpy).sub.3.sup.2.sup.+). The magnetic beads were then trapped on an electrode in the reaction cell of the ORIGIN.sup.® Analyzer by a magnet, and the ECL was evoked from Ru(bpy).sub.3.sup.2.sup.+ on the tagged reporter antibodies by an electrical potential at the electrode. Preliminary IM-ECL assays with Eubacteria yielded a detection limit of 10.sup.5 cfu/mL. Preliminary IM-ECL assays with S. typhimurium yielded a similar detection limit of 10.sup.5 cfu/mL.

DUPLICATE 3

AB Bifidobacterium bifidus var. Pennsylvanicus, a microaerophilic anaerobe, was grown in the presence of several potential growth inhibitors with the aim of defining its growth requirements and metabolic peculiarities. The following had no effect on its growth: citrate, serum transferrin, serum albumin, colchicine, fluoro-acetate, malonate, and rotenone. The following substances inhibited the growth: fluoride, azide, arsenite, 2, 4-dinitrophenol, hemin, hemoglobin, lactoferrin, alpha, alpha'-bipyridyl, and 8-hydroxyquinoline. Ferrous iron was able to negate the inhibition achieved by alpha, alpha'-bipyridyl, and 8-hydroxyquinoline. It is concluded that iron, probably in its ferrous state, is an obligatory nutrient for the microorganism, and that iron-porphyrin system(s) may be essential for the metabolism of this organism. Because the microorganisms contained in addition to iron large quantities of Mn, Zn, and Cu, it is likely that these metalloelements are crucial for the normal growth of the organism. Growth inhibition by fluoride indicates that Mg-dependent enzymes may also be present in the microorganism.
